(54) Title: PIPERIDINE AND TETRAHYDROPIRIDINE DERIVATIVES

(57) Abstract

A class of substituted piperidine and tetrahydropyridine derivatives, linked through the 4-position thereof via an alkylene chain to a fused bicyclic heteroaromatic moiety such as indolyl, and further substituted at the 1-position by an optionally substituted alkyl, alkenyl, alkynyl, cycloalkyl-alkyl, aryl-alkyl or heteroaryl-alkyl moiety, are selective agonists of 5-HT<sub>1D</sub>-like receptors, being potent agonists of the human 5-HT<sub>1D</sub> receptor subtype whilst possessing at least a 10-fold selective affinity for the 5-HT<sub>1D</sub> receptor subtype relative to the 5-HT<sub>1A</sub> subtype; they are therefore useful in the treatment and/or prevention of clinical conditions, in particular migraine and associated disorders, for which a subtype-selective agonist of 5-HT<sub>1D</sub> receptors is indicated, whilst eliciting fewer side-effects, notably adverse cardiovascular events, than those associated with non-subtype-selective 5-HT<sub>1D</sub> receptor agonists.

PIPERIDINE AND TETRAHYDROPYRIDINE DERIVATIVES

The present invention relates to a class of substituted piperidine and tetrahydropyridine derivatives which act on 5-hydroxytryptamine 5 (5-HT) receptors, being selective agonists of so-called "5-HT<sub>1</sub>-like" receptors. They are therefore useful in the treatment of clinical conditions for which a selective agonist of these receptors is indicated.

It has been known for some time that 5-HT<sub>1</sub>-like receptor agonists which exhibit selective vasoconstrictor activity are of use in the treatment 10 of migraine (see, for example, A. Doenicke *et al.*, *The Lancet*, 1988, Vol. 1, 1309-11; and W. Feniuk and P.P.A. Humphrey, *Drug Development Research*, 1992, 26, 235-240).

The human 5-HT<sub>1</sub>-like or 5-HT<sub>1D</sub> receptor has recently been shown by molecular cloning techniques to exist in two distinct subtypes. These 15 subtypes have been termed 5-HT<sub>1Dα</sub> (or 5-HT<sub>1D.1</sub>) and 5-HT<sub>1Dβ</sub> (or 5-HT<sub>1D.2</sub>), and their amino acid sequences are disclosed and claimed in WO-A-91/17174.

The 5-HT<sub>1Dα</sub> receptor subtype in humans is believed to reside on sensory terminals in the dura mater. Stimulation of the 5-HT<sub>1Dα</sub> subtype 20 inhibits the release of inflammatory neuropeptides which are thought to contribute to the headache pain of migraine. The human 5-HT<sub>1Dβ</sub> receptor subtype, meanwhile, is located predominantly on the blood vessels and in the brain, and hence may play a part in mediating constriction of cerebral and coronary arteries, as well as CNS effects.

25 Administration of the prototypical 5-HT<sub>1D</sub> agonist sumatriptan (GR43175) to humans is known to give rise at therapeutic doses to certain adverse cardiovascular events (see, for example, F. Willett *et al.*, *Br. Med. J.*, 1992, 304, 1415; J.P. Ottervanger *et al.*, *The Lancet*, 1993, 341, 861-2; and D.N. Bateman, *The Lancet*, 1993, 341, 221-4). Since sumatriptan 30 barely discriminates between the human 5-HT<sub>1Dα</sub> and 5-HT<sub>1Dβ</sub> receptor subtypes (cf. WO-A-91/17174, Table 1), and since it is the blood vessels

- 2 -

with which the 5-HT<sub>1D<sub>B</sub></sub> subtype is most closely associated, it is believed that the cardiovascular side-effects observed with sumatriptan can be attributed to stimulation of the 5-HT<sub>1D<sub>B</sub></sub> receptor subtype. It is accordingly considered (cf. G.W. Rebeck *et al.*, *Proc. Natl. Acad. Sci. USA*, 1994, 91, 5 3666-9) that compounds which can interact selectively with the 5-HT<sub>1D<sub>A</sub></sub> receptor subtype, whilst having a less pronounced action at the 5-HT<sub>1D<sub>B</sub></sub> subtype, might be free from, or at any rate less prone to, the undesirable cardiovascular and other side-effects associated with non-subtype-selective 10 5-HT<sub>1D</sub> receptor agonists, whilst at the same time maintaining a beneficial level of anti-migraine activity.

The compounds of the present invention, being selective 5-HT<sub>1</sub>-like receptor agonists, are accordingly of benefit in the treatment of migraine and associated conditions, e.g. cluster headache, chronic paroxysmal hemicrania, headache associated with vascular disorders, tension 15 headache and paediatric migraine. In particular, the compounds according to this invention are potent agonists of the human 5-HT<sub>1D<sub>A</sub></sub> receptor subtype. Moreover, the compounds in accordance with this invention have been found to possess at least a 10-fold selective affinity for the 5-HT<sub>1D<sub>A</sub></sub> receptor subtype relative to the 5-HT<sub>1D<sub>B</sub></sub> subtype, and they can 20 therefore be expected to manifest fewer side-effects than those associated with non-subtype-selective 5-HT<sub>1D</sub> receptor agonists.

Several distinct classes of substituted five-membered heteroaromatic compounds are described in published European patent applications 0438230, 0494774 and 0497512, and published International 25 patent applications 93/18029, 94/02477 and 94/03446. The compounds described therein are stated to be agonists of 5-HT<sub>1</sub>-like receptors, and accordingly to be of particular use in the treatment of migraine and associated conditions. None of these publications, however, discloses nor even suggests the substituted piperidine and tetrahydropyridine 30 derivatives provided by the present invention.

- 3 -

In EP-A-0548813 is described a series of alkoxyypyridin-4-yl and alkoxyypyrimidin-4-yl derivatives of indol-3-ylalkylpiperazines which are alleged to provide treatment of vascular or vascular-related headaches, including migraine. There is, however, no disclosure nor any suggestion in 5 EP-A-0548813 of replacing the substituted piperazine moiety with a differently substituted piperidine or tetrahydropyridine moiety.

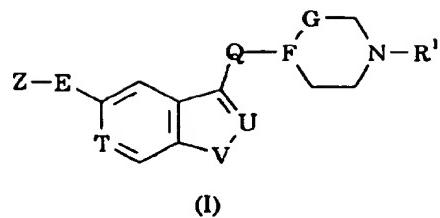

WO-A-91/18897 describes a class of tryptamine derivatives substituted by various five-membered rings, which are stated to be specific to a particular type of "5-HT<sub>1</sub>-like" receptor and thus to be effective agents 10 for the treatment of clinical conditions, particularly migraine, requiring this activity. A further class of tryptamine derivatives with alleged anti-migraine activity is disclosed in WO-A-94/02460. However, neither WO-A-91/18897 nor WO-A-94/02460 discloses or suggests the substituted piperidine and tetrahydropyridine derivatives provided by the present 15 invention.

Moreover, nowhere in the prior art mentioned above is there any disclosure of a subtype-selective 5-HT<sub>1D</sub> receptor agonist having a 5-HT<sub>1D<sub>a</sub></sub> receptor binding affinity (IC<sub>50</sub>) below 50 nM and at least a 10-fold selective affinity for the 5-HT<sub>1D<sub>a</sub></sub> receptor subtype relative to the 5-HT<sub>1D<sub>b</sub></sub> subtype.

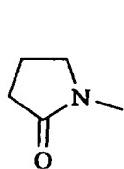

20 The compounds according to the present invention are subtype-selective 5-HT<sub>1D</sub> receptor agonists having a human 5-HT<sub>1D<sub>a</sub></sub> receptor binding affinity (IC<sub>50</sub>) below 100 nM, typically below 50 nM, suitably below 10 nM and preferably below 1 nM; and at least a 10-fold selective affinity, typically at least a 50-fold selective affinity and preferably at 25 least a 100-fold selective affinity, for the human 5-HT<sub>1D<sub>a</sub></sub> receptor subtype relative to the 5-HT<sub>1D<sub>b</sub></sub> subtype. Moreover, the compounds in accordance with this invention possess interesting properties in terms of their efficacy and/or bioavailability.

The present invention provides a compound of formula I, or a salt or 30 prodrug thereof:

- The invention also provides pharmaceutical compositions comprising one or more compounds of this invention in association with a pharmaceutically acceptable carrier. Preferably these compositions are in unit dosage forms such as tablets, pills, capsules, powders, granules, 10 sterile parenteral solutions or suspensions, metered aerosol or liquid sprays, drops, ampoules, auto-injector devices or suppositories; for oral, parenteral, intranasal, sublingual or rectal administration, or for administration by inhalation or insufflation. For preparing solid compositions such as tablets, the principal active ingredient is mixed with 15 a pharmaceutical carrier, e.g. conventional tabletting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a 20 pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation 25 composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. Typical unit dosage forms contain from 1 to 100 mg, for example 1, 2, 5, 10, 25, 50 or 100 mg, of the active ingredient. The tablets or pills of the novel composition can be coated or otherwise compounded to 30 provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer

dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A 5 variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection 10 include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as 15 tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinyl-pyrrolidone or gelatin.

In the treatment of migraine, a suitable dosage level is about 0.01 to 250 mg/kg per day, preferably about 0.05 to 100 mg/kg per day, and especially about 0.05 to 5 mg/kg per day. The compounds may be 20 administered on a regimen of 1 to 4 times per day.

The compounds according to the invention may be prepared by a process which comprises attachment of the R<sup>1</sup> moiety to a compound of formula III:

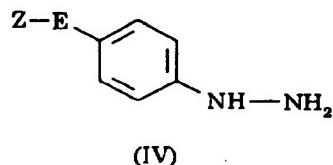

wherein Z, E, Q, T, U, V, F and G are as defined above; by conventional means including N-alkylation.

- Attachment of the R<sup>1</sup> moiety to the compounds of formula III may conveniently be effected by standard alkylation techniques. One example 5 thereof comprises treatment with an alkenyl halide such as 4-bromobut-1-ene, 4-bromo-2-methylbut-2-ene or allyl bromide, an alkynyl halide such as propargyl bromide, or an aryl(C<sub>1-6</sub>)alkyl or heteroaryl(C<sub>1-6</sub>)alkyl halide such as benzyl iodide, typically under basic conditions, e.g. sodium hydride in *N,N*-dimethylformamide, or potassium carbonate in isopropanol.
- 10 Another example comprises treatment of the compound of formula III with an aryl(C<sub>1-6</sub>)alkyl or heteroaryl(C<sub>1-6</sub>)alkyl mesylate such as 2-(thiazol-2-yl)propyl methanesulphonate, ideally in the presence of a base such as sodium carbonate, in a suitable solvent such as 2-propanol, typically at the reflux temperature of the solvent. A further example, for the preparation 15 of a compound of formula I in which R<sup>1</sup> is substituted with hydroxy, comprises treating the requisite compound of formula III with an epoxide derivative such as  $\alpha$ -methylstyrene epoxide, typically in a solvent such as methanol in a sealed tube at an elevated temperature.

- Alternatively, the R<sup>1</sup> moiety may conveniently be attached by 20 reductive alkylation, which may be accomplished in a single step, or as a two-step procedure. The single-step approach suitably comprises treating the required compound of formula III as defined above with the appropriate aldehyde, e.g. benzaldehyde, pyridine carboxaldehyde, furfuraldehyde or thiophene carboxaldehyde, in the presence of a reducing 25 agent such as sodium cyanoborohydride. In a typical two-step procedure, for the preparation of a compound of formula I wherein R<sup>1</sup> corresponds to a group of formula -CH<sub>2</sub>R<sup>11</sup>, a carboxylic acid derivative of formula R<sup>11</sup>-CO<sub>2</sub>H is condensed with the required compound of formula III, suitably in the presence of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride 30 and 1-hydroxybenzotriazole hydrate, to afford a compound corresponding to formula I wherein R<sup>1</sup> represents -COR<sup>11</sup>; the carbonyl group thereof can

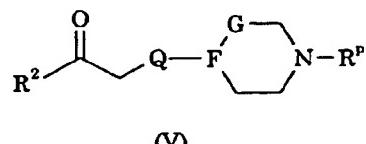

then be reduced, for example by treatment with diisobutylaluminium hydride, and the required compound of formula I thereby obtained.

The compounds of formula III above wherein T represents CH, U represents C-R<sup>2</sup> and V represents N-R<sup>3</sup>, corresponding to the indole derivatives of formula ID as defined above wherein T represents CH and R<sup>1</sup> is hydrogen, may be prepared by a process which comprises reacting a compound of formula IV:

10

wherein Z and E are as defined above; with a compound of formula V, or a carbonyl-protected form thereof:

15

wherein Q, F, G and R<sup>2</sup> are as defined above, and R<sup>p</sup> represents an amino-protecting group; followed, where required, by N-alkylation by standard methods to introduce the moiety R<sup>3</sup>; with subsequent removal of the amino-protecting group R<sup>p</sup>.

20

The reaction between compounds IV and V, which is an example of the well-known Fischer indole synthesis, is suitably carried out by heating the reagents together under mildly acidic conditions, e.g. 4% sulphuric acid at reflux.

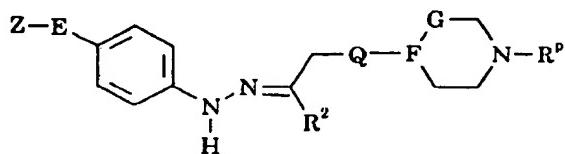

25

Suitable carbonyl-protected forms of the compounds of formula V include the dimethyl acetal or ketal derivatives.

- 25 -

The protecting group  $R^p$  in the compounds of formula V is suitably a carbamoyl moiety such as *tert*-butoxycarbonyl (BOC), which can conveniently be removed as necessary by treatment under mildly acidic conditions. Indeed, the acidic conditions of the Fischer indole synthesis  
5 reaction will generally suffice to remove the BOC group.

The Fischer reaction between compounds IV and V may be carried out in a single step, or may proceed via an initial non-cyclising step at a lower temperature to give an intermediate of formula VI:

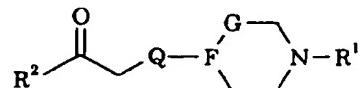

10

(VI)

wherein Z, E, Q, F, G, R<sup>2</sup> and R<sup>p</sup> are as defined above; followed by cyclisation using a suitable reagent, e.g. a polyphosphate ester.

The compounds according to the invention wherein T represents  
15 CH, U represents C.R<sup>2</sup> and V represents N.R<sup>3</sup> - i.e. the indole derivatives of formula ID as defined above wherein T represents CH - may alternatively be prepared by a process which comprises reacting a compound of formula IV as defined above with a compound of formula VII, or a carbonyl-protected form thereof:

20

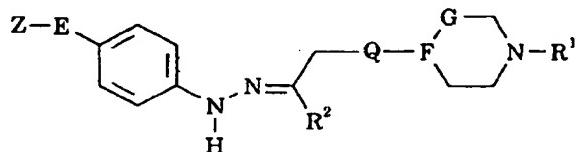

(VII)

wherein Q, F, G, R<sup>1</sup> and R<sup>2</sup> are as defined above; under conditions analogous to those described above for the reaction between compounds IV

and V; followed, where required, by N-alkylation by standard methods to introduce the moiety R<sup>3</sup>.

As for the compounds of formula V, suitable carbonyl-protected forms of the compounds of formula VII include the dimethyl acetal or ketal derivatives. Where the alkylene chain Q is substituted by a hydroxy group, this group may condense with the carbonyl moiety in compounds V and VII, whereby the carbonyl moiety is protected in the form of a cyclic hemiacetal.

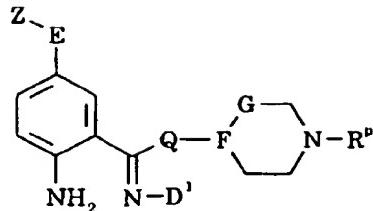

As with that between compounds IV and V, the Fischer reaction between compounds IV and VII may be carried out in a single step, or may proceed via an initial non-cyclising step at a lower temperature to give an intermediate of formula VIII:

15

wherein Z, E, Q, F, G, R<sup>1</sup> and R<sup>2</sup> are as defined above; followed by cyclisation using a suitable reagent, e.g. a polyphosphate ester.

In a further procedure, the compounds of formula III above wherein T represents CH, U represents nitrogen and V represents N-R<sup>3</sup>, corresponding to the indazole derivatives of formula IB as defined above wherein R<sup>1</sup> is hydrogen, may be prepared by a process which comprises cyclising a compound of formula IX:

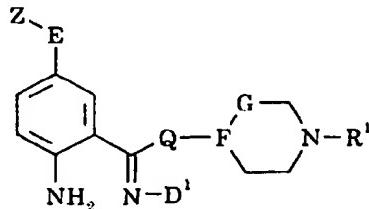

(IX)

wherein Z, E, Q, F, G and R<sup>p</sup> are as defined above, and D<sup>1</sup> represents a readily displaceable group; followed, where required, by N-alkylation by standard methods to introduce the moiety R<sup>3</sup>; with subsequent removal of  
5 the amino-protecting group R<sup>p</sup>.

Similarly, the compounds of formula I wherein T represents CH, U represents nitrogen and V represents N-R<sup>3</sup> - i.e. the indazole derivatives of formula IB as defined above - may be prepared by a process which comprises cyclising a compound of formula X:

10

(X)

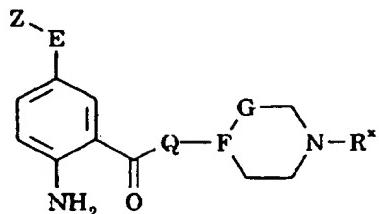

in which Z, E, Q, F, G, R<sup>1</sup> and D<sup>1</sup> are as defined above; followed, where required, by N-alkylation by standard methods to introduce the moiety R<sup>3</sup>.

The cyclisation of compounds IX and X is conveniently achieved in a  
15 suitable organic solvent at an elevated temperature, for example in a mixture of *m*-xylene and 2,6-lutidine at a temperature in the region of 140°C.

The readily displaceable group D<sup>1</sup> in the compounds of formula IX and X suitably represents a C<sub>1-4</sub> alkanoyloxy group, preferably acetoxy.

20 Where D<sup>1</sup> represents acetoxy, the desired compound of formula IX or X

may be conveniently prepared by treating a carbonyl compound of formula XI:

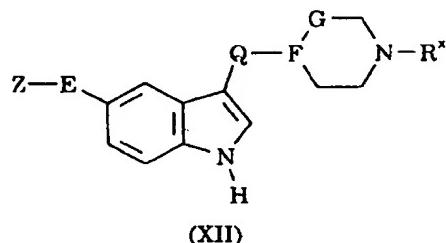

(XI)

wherein Z, E, Q, F and G are as defined above, and Rx corresponds to the group R<sup>1</sup> as defined above, or Rx represents an amino-protecting group as defined for R<sup>p</sup>; or a protected derivative thereof, preferably the N-formyl protected derivative; with hydroxylamine hydrochloride, advantageously in pyridine at the reflux temperature of the solvent; followed by acetylation with acetic anhydride, advantageously in the presence of a catalytic quantity of 4-dimethylaminopyridine, in dichloromethane at room temperature.

10 The N-formyl protected derivatives of the intermediates of formula XI may conveniently be prepared by ozonolysis of the corresponding indole derivative of formula XII:

(XII)

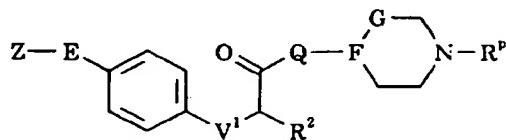

15 20 wherein Z, E, Q, F, G and Rx are as defined above; followed by a reductive work-up, advantageously using dimethylsulphide.

- 29 -

The indole derivatives of formula XII may be prepared by methods analogous to those described in the accompanying Examples, or by procedures well known from the art.

In a still further procedure, the compounds of formula III above 5 wherein T represents CH, U represents C-R<sup>2</sup> and V represents oxygen or sulphur, corresponding to the benzofuran or benzthiophene derivatives of formula IA wherein V is oxygen or sulphur respectively and R<sup>1</sup> is hydrogen, may be prepared by a process which comprises cyclising a compound of formula XIII:

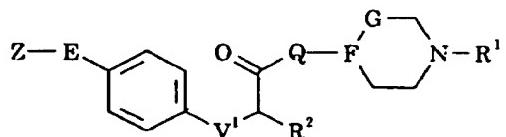

10

(XIII)

wherein Z, E, Q, F, G, R<sup>2</sup> and R¹ are as defined above, and V¹ represents oxygen or sulphur; followed by removal of the amino-protecting group R¹.

15 Similarly, the compounds of formula I wherein T represents CH, U represents C-R<sup>2</sup> and V represents oxygen or sulphur - i.e. the benzofuran or benzthiophene derivatives of formula IA above - may be prepared by a process which comprises cyclising a compound of formula XIV:

20

- 30 -

The cyclisation of compounds XIII and XIV is conveniently effected by using polyphosphoric acid or a polyphosphate ester, advantageously at an elevated temperature.

5      The compounds of formula XIII and XIV may be prepared by reacting a compound of formula XV with a compound of formula XVI:

(XV)

(XVI)

wherein Z, E, Q, F, G, R<sup>2</sup>, V<sup>1</sup> and R<sup>x</sup> are as defined above, and Hal represents a halogen atom.

10     The reaction is conveniently effected in the presence of a base such as sodium hydroxide.

The hydroxy and mercapto derivatives of formula XV may be prepared by a variety of methods which will be readily apparent to those skilled in the art. One such method is described in EP-A-0497512.

15     The hydrazine derivatives of formula IV above may be prepared by methods analogous to those described in EP-A-0438230, EP-A-0497512, EP-A-0548813 and WO-A-91/18897.

Where they are not commercially available, the starting materials of formula V, VII and XVI may be prepared by methods analogous to those described in the accompanying Examples, or by standard procedures well known from the art.

20     It will be understood that any compound of formula I initially obtained from any of the above processes may, where appropriate, subsequently be elaborated into a further compound of formula I by techniques known from the art. For example, a compound of formula I wherein -F-G- represents -C=CH- initially obtained may be readily converted into the corresponding compound wherein -F-G- represents

-CH-CH<sub>2</sub>- by conventional catalytic hydrogenation procedures. A compound of formula I initially obtained wherein Q is substituted by hydroxy may be converted into the corresponding compound wherein Q is substituted by an oxo moiety by treatment with an oxidizing agent,

5     suitably sulphur trioxide-pyridine complex. In addition, a compound of formula I wherein R<sup>1</sup> is benzyl initially obtained may be converted by catalytic hydrogenation to the corresponding compound of formula III, which in turn may be converted into a further compound of formula I using standard N-alkylation techniques as described above. Furthermore,

10    a compound of formula I initially obtained wherein the R<sup>1</sup> moiety is substituted by nitro or cyano may be converted by catalytic hydrogenation to the corresponding amino- or aminomethyl-substituted compound respectively. Additionally, a compound of formula I wherein the R<sup>1</sup> moiety is substituted by hydroxymethyl may be obtained by lithium aluminium

15    hydride reduction of a precursor alkoxy carbonyl derivative; the resulting hydroxy compound may then be mesylated under standard conditions, and the mesyl group subsequently displaced by an amino moiety by treatment with the desired amine in a sealed tube at an elevated temperature. The amine derivative resulting from any of these procedures

20    may then, for example, be N-acylated using the appropriate acyl halide, e.g. acetyl chloride; or aminocarbonylated, using potassium isocyanate, to the corresponding urea derivative; or converted to a 1,2,4-triazol-4-yl derivative using *N,N*-dimethylformamide azine; or reductively alkylated by treatment with the appropriate aldehyde or ketone in the presence of

25    sodium cyanoborohydride. If desired, the amine derivative may also be carbamoylated by treatment with the requisite alkyl chloroformate. A compound of formula I initially obtained wherein the R<sup>1</sup> moiety is substituted by cyano may be converted, by treatment with sodium azide, to the corresponding tetrazole derivative, which in turn may be alkylated

30    on the tetrazole ring by treatment with an alkyl halide under standard conditions. By way of additional illustration, a compound of formula I

initially obtained wherein the R<sup>1</sup> moiety is substituted by an alkoxy carbonyl moiety may be saponified, by treatment with an alkali metal hydroxide, to the corresponding carboxy-substituted compound, which in turn may be converted to an amide derivative by treatment with the appropriate amine, advantageously in the presence of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and 1-hydroxybenzotriazole. Alternatively, a compound of formula I initially obtained wherein the R<sup>1</sup> moiety is substituted by an alkoxy carbonyl moiety may be converted directly to an amide derivative by treatment with the appropriate amine in a sealed tube at an elevated temperature, or in the presence of trimethylaluminium. Moreover, a compound of formula I wherein R<sup>3</sup> is hydrogen initially obtained may be converted into a compound of formula I wherein R<sup>3</sup> represents C<sub>1-6</sub> alkyl by standard alkylation techniques, for example by treatment with an alkyl iodide, e.g. methyl iodide, typically under basic conditions, e.g. sodium hydride in dimethylformamide, or triethylamine in acetonitrile.

Where the above-described processes for the preparation of the compounds according to the invention give rise to mixtures of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography. The novel compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The novel compounds may, for example, be resolved into their component enantiomers by standard techniques such as preparative HPLC, or the formation of diastereomeric pairs by salt formation with an optically active acid, such as (-)-di-p-toluoyl-d-tartaric acid and/or (+)-di-p-toluoyl-l-tartaric acid, followed by fractional crystallization and regeneration of the free base. The novel compounds may also be resolved by formation of diastereomeric esters or amides, followed by chromatographic separation and removal of the chiral auxiliary.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in *Protective Groups in Organic Chemistry*, ed. J.F.W. McOmie, Plenum Press, 1973; and T.W. Greene & P.G.M. Wuts, *Protective Groups in Organic Synthesis*, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known from the art.

The following Examples illustrate the preparation of compounds  
10 according to the invention.

The compounds in accordance with the present invention potently and selectively bind to the 5-HT<sub>1D<sub>α</sub></sub> receptor subtype, inhibit forskolin-stimulated adenylyl cyclase activity, and stimulate [<sup>35</sup>S]-GTPγS binding to membranes from clonal cell lines expressing human cloned receptors.

15

#### 5-HT<sub>1D<sub>α</sub></sub>/5-HT<sub>1D<sub>β</sub></sub> Radioligand Binding

Chinese hamster ovary (CHO) clonal cell lines expressing the human 5-HT<sub>1D<sub>α</sub></sub> and 5-HT<sub>1D<sub>β</sub></sub> receptors were harvested in PBS and  
20 homogenised in ice cold 50 mM Tris-HCl (pH 7.7 at room temperature) with a Kinematica polytron and centrifuged at 48,000g at 4°C for 11 min. The pellet was then resuspended in 50 mM Tris-HCl followed by a 10 min incubation at 37°C. Finally the tissue was recentrifuged at 48,000g, 4°C for 11 min and the pellet resuspended, in assay buffer (composition in mM:  
25 Tris-HCl 50, pargyline 0.01, CaCl<sub>2</sub> 4; ascorbate 0.1%; pH 7.7 at room temperature) to give the required volume immediately prior to use (0.2 mg protein/ml). Incubations were carried out for 30 min at 37°C in the presence of 0.02-150 nM [<sup>3</sup>H]-5-HT for saturation studies or 2-5 nM [<sup>3</sup>H]-5-HT for displacement studies. The final assay volume was 1 ml. 5-HT (10  
30 μM) was used to define non-specific binding. The reaction was initiated by the addition of membrane and was terminated by rapid filtration through

Whatman GF/B filters (presoaked in 0.3% PEI/ 0.5% Triton X) followed by 2 x 4 ml washings with 50 mM Tris-HCl. The radioactive filters were then counted on a LKB beta or a Wallac beta plate counter. Binding parameters were determined by non-linear, least squares regression analysis using an iterative curve fitting routine, from which IC<sub>50</sub> (the molar concentration of compound necessary to inhibit binding by 50%) values could be calculated for each test compound. The IC<sub>50</sub> values for binding to the 5-HT<sub>1D<sub>a</sub></sub> receptor subtype obtained for the compounds of the accompanying Examples were below 100 nM in each case. Furthermore, the compounds of the accompanying Examples were all found to possess a selective affinity for the 5-HT<sub>1D<sub>a</sub></sub> receptor subtype of at least 10-fold relative to the 5-HT<sub>1D<sub>b</sub></sub> subtype.

#### 5-HT<sub>1D<sub>a</sub></sub>/5-HT<sub>1D<sub>b</sub></sub> Adenylyl Cyclase Assay

Studies were performed essentially as described in *J. Pharmacol. Exp. Ther.*, 1986, 238, 248. CHO clonal cell lines expressing the human cloned 5-HT<sub>1D<sub>a</sub></sub> and 5-HT<sub>1D<sub>b</sub></sub> receptors were harvested in PBS and homogenised, using a motor driven teflon/glass homogeniser, in ice cold Tris HCl-EGTA buffer (composition in mM: Tris HCl 10, EGTA 1, pH 8.0 at room temperature) and incubated on ice for 30-60 min. The tissue was then centrifuged at 20,000g for 20 min at 4°C, the supernatant discarded and the pellet resuspended in Tris HCl-EDTA buffer (composition in mM: Tris HCl 50, EDTA 5, pH 7.6 at room temperature) just prior to assay. The adenylyl cyclase activity was determined by measuring the conversion of  $\alpha$ -[<sup>33</sup>P]-ATP to [<sup>33</sup>P]-cyclic AMP. A 10  $\mu$ l aliquot of the membrane suspension was incubated, for 10-15 min, in a final volume of 50  $\mu$ l, at 30°C, with or without forskolin (10  $\mu$ M), in the presence or absence of test compound. The incubation buffer consisted of 50 mM Tris HCl (pH 7.6 at room temperature), 100 mM NaCl, 30  $\mu$ M GTP, 50  $\mu$ M cyclic AMP, 1 mM dithiothreitol, 1 mM ATP, 5 mM MgCl<sub>2</sub>, 1 mM EGTA, 1 mM 3-isobutyl-1-

methylxanthine, 3.5 mM creatinine phosphate, 0.2 mg/ml creatine phosphokinase, 0.5-1  $\mu$ Ci  $\alpha$ -[<sup>33</sup>P]-ATP and 1 nCi [<sup>3</sup>H]-cyclic AMP. The incubation was initiated by the addition of membrane, following a 5 min preincubation at 30°C, and was terminated by the addition of 100  $\mu$ l SDS 5 (composition in mM: sodium lauryl sulphate 2%, ATP 45, cyclic AMP 1.3, pH 7.5 at room temperature). The ATP and cyclic AMP were separated on a double column chromatography system (*Anal. Biochem.*, 1974, **58**, 541). Functional parameters were determined using a least squares curve fitting programme ALLFIT (*Am. J. Physiol.*, 1978, **235**, E97) from which 10  $E_{max}$  (maximal effect) and  $EC_{50}$  (the molar concentration of compound necessary to inhibit the maximal effect by 50%) values were obtained for each test compound. Of those compounds which were tested in this assay, the  $EC_{50}$  values for the 5-HT<sub>1D $\alpha$</sub>  receptor obtained for the compounds of the accompanying Examples were below 500 nM in each case. Moreover, the 15 compounds of the accompanying Examples which were tested were all found to possess at least a 10-fold selectivity for the 5-HT<sub>1D $\alpha$</sub>  receptor subtype relative to the 5-HT<sub>1D $\beta$</sub>  subtype.

#### 5-HT<sub>1D $\alpha$</sub> /5-HT<sub>1D $\beta$</sub> GTP $\gamma$ S Binding

20 Studies were performed essentially as described in *Br. J. Pharmacol.*, 1993, **109**, 1120. CHO clonal cell lines expressing the human cloned 5-HT<sub>1D $\alpha$</sub>  and 5-HT<sub>1D $\beta$</sub>  receptors were harvested in PBS and homogenised using a Kinematica polytron in ice cold 20 mM HEPES 25 containing 10 mM EDTA, pH 7.4 at room temperature. The membranes were then centrifuged at 40,000g, 4°C for 15 min. The pellet was then resuspended in ice cold 20 mM HEPES containing 0.1 mM EDTA, pH 7.4 at room temperature and recentrifuged at 40,000g, 4°C for 15-25 minutes. The membranes were then resuspended in assay buffer (composition in 30 mM: HEPES 20, NaCl 100, MgCl<sub>2</sub> 10, pargyline 0.01; ascorbate 0.1%; pH 7.4 at room temperature) at a concentration of 40  $\mu$ g protein/ml for the

5-HT<sub>1D<sub>a</sub></sub> receptor transfected cells and 40-50 µg protein/ml for the 5-HT<sub>1D<sub>b</sub></sub> receptor transfected cells. The membrane suspension was then incubated, in a volume of 1 ml, with GDP (100 µM for 5-HT<sub>1D<sub>a</sub></sub> receptor transfected cells, 30 µM for the 5-HT<sub>1D<sub>b</sub></sub> receptor transfected cells) and test compound  
5 at 30°C for 20 min and then transferred to ice for a further 15 min.  
[<sup>35</sup>S]-GTPγS was then added at a final concentration of 100 pM and the samples incubated for 30 min at 30°C. The reaction was initiated by the addition of membrane and was terminated by rapid filtration through Whatman GF/B filters and washed with 5 ml water. The radioactive  
10 filters were then counted on a LKB beta counter. Functional parameters were determined by a non-linear, least squares regression analysis using an iterative curve fitting routine, from which E<sub>max</sub> (maximal effect) and EC<sub>50</sub> (the molar concentration of compound necessary to inhibit the maximal effect by 50%) values were obtained for each test compound. Of  
15 those compounds which were tested in this assay, the EC<sub>50</sub> values for the 5-HT<sub>1D<sub>a</sub></sub> receptor obtained for the compounds of the accompanying Examples were below 500 nM in each case. Moreover, the compounds of the accompanying Examples which were tested were all found to possess at least a 10-fold selectivity for the 5-HT<sub>1D<sub>a</sub></sub> receptor subtype relative to  
20 the 5-HT<sub>1D<sub>b</sub></sub> subtype.

1-*tert*-Butyldimethylsilyl-4-pentyn-1-ol (4.6 g, 0.028 mmol) was placed in a dry three-neck flask under  $\text{N}_2$  and charged with tetrahydrofuran (40 ml) and cooled to -78°C. *n*-Butyllithium (1.6M in hexanes, 18.8 ml, 0.030 mol) was added dropwise and the solution stirred at -78°C for 0.5h. N-*tert*-Butyloxycarbonyl-4-piperidone (4.0 g, 0.0184 mol) was dissolved in tetrahydrofuran (10 ml) and added dropwise to the lithio anion and the reaction mixture stirred at -78°C for 0.5h, and then at 0°C for another 0.5h. The reaction was quenched by the slow addition of saturated  $\text{NH}_4\text{Cl}$  (40 ml) and extracted with ethyl acetate (3 x 20 ml). The organic layers were combined, dried over  $\text{MgSO}_4$  and evaporated. The residue was chromatographed on silica using petroleum ether-ethyl

acetate as eluent (9:1→7:3) to give the product as a colourless oil (6.2 g).

DESCRIPTION 5(S)-2-(4-Fluorophenyl)propionic acid

- a) (R)-4-Benzyl-(R and S)-3-[2-(4-fluorophenyl)propionamido]-2-oxazolidinone
- (R)-(+)-4-benzyl-2-oxazolidinone (9.0 g, 50.8 mmol) in dry tetrahydrofuran (250 ml) was cooled to -78°C and butyllithium (32 ml of 1.6M in hexane, 50.8 mmol) was added dropwise to the solution maintaining the temperature below -70°C. After 0.5 hours (R,S)-2-(4-fluorophenyl)propionyl chloride (8.6 g, 46.2 mmol) in tetrahydrofuran (10 ml) was added below -70°C and the reaction was stirred for 0.5 h. Saturated ammonium chloride was added and the reaction was extracted with ethyl acetate, dried (MgSO<sub>4</sub>), filtered and evaporated. The two diastereomers were separated by column chromatography on silica using ethyl acetate/hexane (1:4) to yield the less polar diastereomer tentatively assigned as (R)-4-benzyl-(R)-3-[2-(4-fluorophenyl)propionamido]-2-oxazolidinone (7.5 g); and the more polar isomer, tentatively assigned as (R)-4-benzyl-(S)-3-[2-(4-fluorophenyl)propionamido]-2-oxazolidinone (6.5 g).
- b) (S)-2-(4-Fluorophenyl)propionic acid
- The more polar diastereomer obtained from step a (silica, ethyl acetate/hexane (1:4)) (6.5 g, 19.2 mmol) was dissolved in tetrahydrofuran/water (4:1) (100 ml) and cooled to 0°C. Hydrogen peroxide (30% aqueous solution, 7.9 ml, 77 mmol) was added dropwise below 5°C, followed by lithium hydroxide (0.74 g, 31.0 mmol). The

reaction was allowed to warm to 20°C over 1.5 hours and then quenched with sodium sulfite (12.6 g) in water (75 ml). The reaction was washed with dichloromethane (x3) and the aqueous was acidified to pH 1 at 0°C with hydrochloric acid and then extracted with ethyl acetate (3x) and the organic extract was dried ( $\text{MgSO}_4$ ), filtered, and evaporated to yield an oil, which crystallised on standing (3.11 g).  $^1\text{H}$  NMR (250MHz, DMSO)- $\delta$  1.35 (3H, d,  $J=7.1\text{Hz}$ ), 3.70 (1H, q,  $J=7.1\text{Hz}$ ), 7.10-7.19 (2H, m), 7.29-7.36 (2H, m);  $[\alpha]^{20}_{D}$   $\text{CHCl}_3$  ( $C=1.2$ ) = +57.1°

a) 3-[N-[(tert-butyloxyl)carbonyl]piperidinyl-4-yl]-1,2-propylene oxide  
To sodium hydride (1.2 g, 0.03 mol of a 60% dispersion in oil) and trimethylsulfoxonium iodide (6.6 g, 0.03 mol) at 0°C under N<sub>2</sub> was added anhydrous DMSO dropwise. The ice-bath was removed after complete  
30 addition and the reaction stirred at 25°C for 30 min. The reaction was then cooled to 0°C, and a solution of 2-[N-[(tert-

- butyloxy)carbonyl]piperidin-4-yl]ethyl aldehyde (prepared according to *J. Med. Chem.*, 1994, 37, 2537-2551) (6.8 g, 0.03 mol) was added in a steady stream as a solution in anhydrous DMSO (15 ml). The ice-bath was removed, the reaction stirred at 25°C for 15 min and then at 50°C for 1h.
- 5      The reaction mixture was cooled, quenched with H<sub>2</sub>O (40 ml) then poured into H<sub>2</sub>O (100 ml) and ethyl acetate (50 ml). The reaction mixture was extracted with ethyl acetate (2 x) and the organic layer washed with H<sub>2</sub>O (3 x 20ml). The combined organic extracts were dried over MgSO<sub>4</sub>, evaporated and the residue chromatographed on silica eluting with ethyl acetate: petrol (10:90 to 20:80) to obtain the epoxide as a colourless oil (4.7 g, 49% yield). <sup>1</sup>H NMR (250MHz, CDCl<sub>3</sub>) δ 1.14-1.28 (3H, m), 1.45 (9H, s), 1.63-1.78 (4H, m), 2.44 (1H, dd), 2.71 (2H, t), 2.77 (1H, t), 2.95 (1H, m), 4.12 (2H, m).
- 15     b)    (±)-5-[N-(tert-Butyloxycarbonyl)piperidin-4-yl]-4-hydroxy-1-triethylsilyl-1-pentyne

Distilled boron trifluoride etherate (3.03 ml, 0.025 mol) was then added and the reaction stirred at -78°C for a further 10 min. The epoxide (step a) was then added as a solution in THF (20 ml) and the reaction stirred for 0.75h. The reaction was quenched by the addition of saturated NH<sub>4</sub>Cl and extracted into ethyl acetate. The organic layer was dried over MgSO<sub>4</sub> and evaporated *in vacuo*. The residue was taken up in dioxane:water (1:1, 100 ml) and triethylamine (2.0 ml, 0.0145 mol) added followed by *tert*-butyldicarbonate (3.0 g, 0.0145 mol). The reaction was stirred for 1h, the dioxane evaporated and the residue partitioned between ethyl acetate and saturated NH<sub>4</sub>Cl. The organic layer was collected, dried over MgSO<sub>4</sub> and evaporated. The residue was chromatographed on silica eluting with ethyl acetate:hexanes (1:9→2:8) to

obtain the alcohol as a colourless oil (2.4 g, 49%).  $^1\text{H}$  NMR (250MHz,  $\text{CDCl}_3$ )  $\delta$  0.58 (6H, q), 0.95 (9H, t), 1.08-1.16 (3H, m), 1.45 (9H, s), 1.59-1.78 (4H, m), 2.35 (1H, dd), 2.47 (1H, dd), 2.73 (2H, t), 4.12 (3H, m).

The residue was chromatographed on silica eluting with ethyl acetate:hexanes (1:1) to obtain the product as a colourless oil (0.530 g). <sup>1</sup>H NMR (250MHz, CDCl<sub>3</sub>) δ 1.33 (6H, t), 1.44 (9H, s), 1.51 (4H, m), 1.70 (2H, m), 2.70-2.82 (3H, m), 3.13 (2H, d), 4.02-4.20 (4H, m).

25      b)    4-[3-(5-(1,2,4-Triazol-4-yl)-1H-indol-3-yl)-1-hydroxypropyl]-N-(*tert*-butoxycarbonyl)piperidine

(i)      Sodium hydride (0.084 g, 2.083 mmol, 60% dispersion in oil) was dissolved in anhydrous DMF (5 ml) under N<sub>2</sub> and cooled to 0°C. (*N-tert*-Butoxycarbonylpiperidin-4-yl)-4-keto-diethylmethylphosphonate (step a, 0.530 g, 1.5 mmol) in DMF (3 ml) was added dropwise and the reaction stirred for 1h. 5-(1,2,4-Triazol-4-yl)-1-(N-p-toluenesulfonyl)-indole-3-carboxaldehyde (0.500 g, 1.37 mmol) in hot DMF (5 ml) was then added

and the reaction stirred at 25°C for 16h. The reaction was quenched by the addition of water (30 ml) and extracted with ethyl acetate (2x). The organic layer was washed with water (3x) and dried over MgSO<sub>4</sub> and concentrated *in vacuo*. The residue was purified on silica eluting with CH<sub>2</sub>Cl<sub>2</sub>, then 1-3% MeOH/CH<sub>2</sub>Cl<sub>2</sub> to give 0.300 g of a colourless oil.

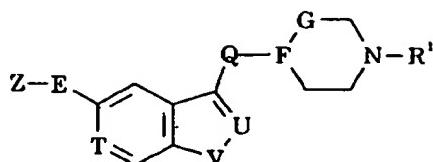

- (ii) The compound from above was hydrogenated over freshly prepared Wilkinson's catalyst (0.025 g) in 5 ml of ethyl acetate for 16h. The solvent was removed and the residue dissolved in ethanol (10 ml) and cooled to 0°C. Sodium borohydride (0.0368 g) was added and the reaction 10 stirred at 0°C for 1h. The solvent was removed and the reaction partitioned between n-butanol/water. The organic layer was evaporated and the residue chromatographed on silica eluting with CH<sub>2</sub>Cl<sub>2</sub>, then 1-10% MeOH/CH<sub>2</sub>Cl<sub>2</sub> to obtain 0.212 g of a colourless oil.

Prepared according to the method described for Example 48, step e using the compound from above (step b) and ( $\pm$ )-2-phenylpropionaldehyde. The resulting compound was refluxed with KOH (0.034 g) in MeOH (5 ml) 20 for 16h. The compound was purified by preparative thin layer chromatography. <sup>1</sup>H NMR (360MHz, DMSO)  $\delta$  1.27 (3H, d), 1.40 (1H, m), 1.42-1.90 (9H, m), 2.73 (2H, m), 2.87 (2H, m), 3.26 (2H, m), 3.38 (1H, m). **INTERNATIONAL SEARCH REPORT**

I: International application No.

**PCT/GB 96/02795****Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  
**Although claim 13 is directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.**
2.  Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- The additional search fees were accompanied by the applicant's protest.  
 No protest accompanied the payment of additional search fees.
